Merge & Concat

Merge

- SQL에서 많이 사용하는 Merge와 같은 기능
- 두 개의 데이터를 하나로 합침

	subject_id	test_score
0	1	51
1	2	15
2	3	15
3	4	61
4	5	16
5	7	14

	subject_id	first_name	last_name
0	4	Billy	Bonder
1	5	Brian	Black
2	6	Bran	Balwner
3	7	Bryce	Brice
4	8	Betty	Btisan

Merge

subject_id 기준으로 merge

pd.merge(df_a, df_b, on='subject_id')

	subject_id	test_score
0	1	51
1	2	15
2	3	15
3	4	61
4	5	16
5	7	14

	subject_id	test_id	first_name	last_name	
0	4	61	Billy	Bonder	0
1	5	16	Brian	Black	1
2	7	14	Bryce	Brice	2
3	8	15	Betty	Btisan	3
					4

Merge

두 dataframe의 column이름이 다를 때

```
pd.merge(df_a, df_b, left_on='subject_id', right_on='subject_id')
```

	subject_id	test_score	first_name	last_name
0	4	61	Billy	Bonder
1	5	16	Brian	Black
2	7	14	Bryce	Brice
3	8	15	Betty	Btisan

DB
Persistence

Database connection

- Data loading 시 db connection 기능을 제공함

```
import sqlite3
```

Database 연결 코드

```
conn = sqlite3.connect("./data/flights.db")
cur = conn.cursor()
cur.execute("select * from airlines limit 5;")
results = cur.fetchall()
results
```

db 연결 conn을 사용하여 dataframe 생성

```
df_airlines = pd.read_sql_query("select * from airlines;", conn)
df_airports = pd.read_sql_query("select * from airports;", conn)
df_routes = pd.read_sql_query("select * from routes;", conn)
```

XLS persistence

- Dataframe의 엑셀 추출 코드
- Xls 엔진으로 openpyxl 또는 XlsxWriter 사용

```
writer = pd.ExcelWriter('./data/df_routes.xlsx', engine='xlsxwriter')
df_routes.to_excel(writer, sheet_name='Sheet1')
```

Pickle persistence

- 가장 일반적인 python 파일 persistence
- to_pickle, read_pickle 함수 사용

```
df_routes.to_pickle("./data/df_routes.pickle")
```

```
df_routes_pickle = pd.read_pickle("./data/df_routes.pickle")
df_routes_pickle.head()
```
